Senior Full Stack Engineer | GridUnity

Cover letter

Hi GridUnity team,

The part of interconnection that caught my attention is the handoff. A developer needs to know what's missing from an application, a utility needs a defensible record of its review, and an operator needs to see what changed without piecing together emails. I like building software that makes those steps easier to follow without hiding the underlying rules.

At NuPrice, I built and ran a marketplace repricing product for a long-term client. Merchants could define the rules, see what the system was doing with competitor data, and check the resulting prices. I also owned subscriptions and customer support, which meant I had to be able to explain what the software was doing when a customer needed help. In my completed work on Proofmark, I used React, Next.js, tRPC and PostgreSQL to connect document preparation, identity, signing and audit history. What mattered there was that the interface and the underlying record agreed about what had happened and what could happen next.

I bring an operator's perspective to that work. At Front Range Internet, I ran the NOC and built diagnostics so the next engineer on call had somewhere better to start than a blank terminal. At Technomancy IT, I've carried that into client delivery: work out the data and access boundaries early, make supportable choices, and stay close to what happens after release. I like sharing the reasoning behind a design, especially when a teammate will be the one debugging it later.

I'd like to bring that mix of product engineering and production ownership to GridUnity. I'd be especially interested in how your team models a review as it moves across organizations, where the workflow needs to be configurable and where everyone needs a consistent record to trust.
